NEW STUDY SHOWS CLEAROGEN ACNE TREATMENT MORE EFFECTIVE THAN CONVENTIONAL OTC ACNE MEDICATION- 5% BPO

Advanced Skin and Hair, Inc. conducted a Multi-Center eight (8) week, double-blind, placebo-controlled, randomized clinical trial using eighty (80) healthy males and females. Clearogen was compared to Benzoyl Peroxide 5% in efficacy, a typical over the counter treatment for acne. The effectiveness was evaluated visually by Board Certified Dermatologists through lesion counts and instrumentally using the Sebumeter and Sebutape collection at baseline and weeks 2, 4 and 8. Comparatively, Clearogen trend wise significantly outperformed Benzoyl Peroxide 5% in both inflammatory and non-inflammatory acne lesions. In addition, Clearogen resulted in a significant reduction in signs of irritation, erythema, indicating effectiveness without concomitant skin irritation. Clearogen was also shown to decrease sebum production using the Sebumeter which can be attributed to Clearogen's ability to reduce DiHydroTestosterone (DHT). Clearogen's ability to reduce DHT was also confirmed via constructed human skin.

Clearogen is the first and only topical acne treatment to block DHT which is the root cause of acne. By blocking DHT, Clearogen effectively prevents overproduction of oil in the sebaceous glands which is the first step in acne formation.

Clearogen was formulated by Los Angeles Dermatologist Dr. Alex Khadavi, after seeing in his own practice that most acne patients did not respond well to over the counter acne treatments and required oral anti-DHT medications to block DHT as well. Dr. Khadavi formulated Clearogen to eliminate the need for oral medications and to provide a comprehensive topical acne treatment to acne sufferers.
